Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

- Why should we measure TCP?
  - TCP is the backbone of the Internet
  - TCP needs to keep up with evolving Internet
  - Analytical models are hard

# Metrics

TCP

Measurements

Jiri Hamberg

Introduction

**Metrics**

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

- Throughput (and goodput)
- Fairness
- Latency
- Loss Rate
- Burstiness

# Throughput and Goodput

TCP

Measurements

Jiri Hamberg

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

**Throughput:** the amount of data transferred in a unit of time

**Goodput:** the amount of payload transferred in a unit of time

# Fairness

TCP

Measurements

Jiri Hamberg

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

Intuitively, fairness means that resources are distributed evenly

Jain et al. (1984)

$$f(\mathbf{x}) = \frac{\left(\sum_{i=1}^n x_i\right)^2}{n \sum_{i=1}^n x_i^2}$$

- Scale independent
- Bounded
- Continuous

# Other Metrics

Conclusion

Latency

Loss Rate

Burstiness

# Measurement Platforms

TCP

Measurements

Jiri Hamberg

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

Measurement platforms offer different ways to set up experiments

- Testbed
- Live Internet Test
- Simulation
- Emulation

# Testbed

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

Testbed is an isolated network where experiments can be conducted

- Provides total control over the experiment - no interference
- Does not scale well

# Live Internet Test

TCP

Measurements

Jiri Hamberg

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

Use a mesh geographically distributed hosts for conducting measurements

- Can measure on  $O(n^2)$  network paths with  $n$  hosts
- Inexpensive and realistic results
- Hard to control and measure the network paths

# Simulation

TCP

Measurements

Jiri Hamberg

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

Use a scriptable general purpose simulation framework or write your own

- Cheap, fast and scalable
- Lose some details compared to conventional measurements
- Results may require validation with real experiments

# Emulation

TCP

Jiri Hamberg

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

The study used ns2 network simulations to evaluate goodput and fairness common TCP congestion control algorithms

Algorithms evaluated

- New Reno
- Compound
- Cubic

Wired and wireless connections were simulated

# New Reno

TCP

Measurements

Jiri Hamberg

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

Default congestion control implementation of some versions of OSX

TCP Reno implements the fast recovery algorithm

- 3 duplicate ACKs trigger a re-transmission

New Reno improves the fast recovery algorithm by being able to handle multiple packet drops in a single congestion window with only one window reduction

# Compound

TCP  
Measurements

Jiri Hamberg

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

Introduced in Windows Vista and Windows Server 2008

Maintains exponentially smoothed estimate of the RTT

- Estimate is used in calculating the current window size during TCP congestion avoidance
- Congestion window consists of two components: the regular congestion window and a RTT based component
- Conjoined effect is approximately

$$win(t + 1) = win(t) + \alpha * win(t)^k$$

when no packet loss or early congestion is detected, and

$$win(t + 1) = win(t) * (1 - \beta)$$

otherwise

# Cubic

TCP

Measurements

Jiri Hamberg

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

The default congestion control implementation of Linux kernel from version 2.6.19 onwards

Cubic replaces slow start and congestion avoidance phase with a single phase where the congestion window is given by the following formula

$$W_{cubic}(t) = C(t - K)^3 + W_{max}$$

where  $K = (W_{max}\beta/C)^{1/3}$ ,  $W_{max}$  is the largest window size before last window reduction and  $C$  and  $\beta$  are free parameters.

# Wired Simulation: Goodput

TCP  
Measurements

Jiri Hamberg

Introduction

Metrics

Measurement  
Platforms

Evaluating  
Congestion  
Control  
Algorithms

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

Figure : Topology of the wired ns2 simulation

	Compound	Cubic	New Reno	Rev. Traffic
0s-250s Mbps	1.99	1.99	1.98	No
250s-500s Mbps	1.79	1.96	1.71	Yes
500s-750s Mbps	2.00	2.00	1.99	No
750s-1000s Mbps	1.80	1.96	1.76	Yes

Table : Goodput achieved by each TCP variant with and without reverse traffic at different time intervals.

Improving  
TCP Startup  
Performance  
Using Active  
Measurements

Conclusion

Study introduces a novel TCP startup algorithm, *paced start*

- Estimates the available bandwidth using *Packet Transmission Rate* (PTR) method

*Paced start* is compared with the *slow start*

- Simulations with ns2
- Measurements on the Emulab testbed

# Paced Start

Figure : Slow start algorithm moves along the X-axis until a suitably large cwnd is found (or ssthresh is hit). Paced start also considers the Y-axis, doing a binary search to find the suitable sending rate
